

Orthogonal design space: flow organization x processing unit

Flow organization A

Processing unit P

	radix-2	radix-4	vector / Cube	specialized FFT
materialized stages	candidate lower + measure	possible contract required	possible contract required	possible contract required
resident subgraph	candidate if lowered	abstract only not production yet	abstract only not production yet	abstract only not production yet

Hardware H + lowering contract: UB, alignment, GM, instruction envelope, ownership and sync
Only legal intersections enter the model and measured selection; all others abstain.

Flow and core are conceptually independent, but their physical resource costs are coupled.
